

BAD GOLF

Admin Guide

The complete admin toolkit - course mapping, the Guided Verify hub, ratings & pars editors, user management, analytics, and every back-office tool.

v2026.11.918 • August 2026

Contents

01 Admin Side Features

02 Common Admin Workflows

03 Admin Tips & Tricks

Admin Side Features

Admin features are accessed via the **Admin tab** (appears only to admins). This section covers course setup, GPS mapping, the code-review queue, user management, and analytics.

How a User Becomes Admin

Admin assignment:

- Existing admin (or system operator) grants the **admin role** via **User Management** dashboard
- User must sign in to see the Admin tab
- Admins see all courses and can map GPS, edit ratings/pars, manage users

Admin permissions:

- Can map courses (GPS)
- Can edit pars and tee ratings/slopes
- Can verify course completeness
- Can delete duplicate courses
- Can lock and unlock a completed state
- Can work the code-review queue
- Can manage user accounts
- Can view analytics dashboard
- Can see every group's card inside a tournament

Course Library Management

"Courses" card (Admin tab):

Search:

- "Search by course name or state..." input
- Searches all courses in the library (across all users)

- Shows results A–Z sorted

Filter chips (tap to narrow the worklist; counts shown on each):

- **All** — every course
- **Not mapped** — no GPS at all
- **Missing holes** — partially mapped
- **Missing rating** — mapped but no rating/slope
- **Needs targets** — mapped + rated, but missing par-4/5 fairway targets
- **Complete** — greens + rating + targets all done
- ☒ **Verified** — manually verified

The list is sorted **incomplete-first** so the courses that still need work float to the top.

Duplicate detection & cleanup:

- Automated duplicate finder flags courses with identical/similar names
- **"Hide duplicates"** button — temporarily hide suspected dupes from the list
- **"Show map view"** button — see courses on a map (helps spot phantom duplicates)

On every course card:

- **"Review history >"** — an orange link directly under the "· tap to edit >" line, on any course with a code-review entry (open **or** finished). It opens the same full timeline as the Code Review queue, so you don't have to go back to the queue to see the history of the course you're already looking at.

State Lock — Freezing a Completed State

Once a state's data is finished, lock it so nobody quietly undoes the work.

Where: Admin tab → Course worklist, directly under the state picker (appears as soon as a state is selected).

- **"Lock — mark complete & freeze"** — locks it, with a note
- A locked state shows a red banner "**is LOCKED**" with **who** locked it, **when**, and their **note**, plus a **"Unlock"** button
- Locked states carry a **prefix in the state dropdown**

What the lock stops — *all admin data writes for that state*: course edits, GPS mapping, deletes, renames, the tees and pars editors, verify/skip toggles, three-nine wiring, and imports/sweeps. A **nationwide import skips locked states and processes the rest**, and the import log lists exactly what it skipped.

What the lock does NOT stop — **scoring, betting, and settle-up are completely unaffected**. Players use a locked state's courses exactly as normal. Code-review flags and missing-course reports are still accepted.

Unlocking requires **typing the state name** to confirm. Any admin can do it, and both the lock and the unlock are written to the audit log. The whole control is mobile-first (full-width, 48px tap targets).

△The lock is an **app-UI marker, not a database constraint** — a direct database write bypasses it. Treat it as policy, not enforcement.

Code Review Queue (with Full Audit Trail)

Every review entry carries a permanent, **append-only** history, so nothing gets lost between sessions.

On each card:

- **"History (n)"** — a full-width button on every card
- **"Log work"** — on open items
- Each card shows **"last update by "** so the queue is scannable without opening anything

The **history sheet** opens with a red **"»Still needed"** panel showing the most recent outstanding ask, then the full timeline (who, when, what). Footer buttons:

- **"Add a note"**  
- **"Log work"** — three fields: **what I fixed** / **what I couldn't do and why** / **what's still needed**
- **"Copy full history"** — plain text, for pasting elsewhere

Rules:

- **A note is now REQUIRED** to both **" Mark complete"** and **" Send back."** The and status taps stay one tap.
- Kevin has full visibility and **can reply in the same thread**.
- Events log automatically when a review is filed, on status changes, on notes, and when a **photo is attached to a course** (logged against every open item for that course).
- Entries from before the audit trail shipped show a back-filled starter timeline rather than a blank history.
- The **"Send for code review"** note field no longer auto-fills with your last pasted text.

Guided Verify Hub

The **Guided Verify Hub** (openCourseDetail) is the step-by-step interface for admins to map and verify a course.

Opening a course:

- Tap a course card in the library
- Opens **Guided Verify Hub** with numbered steps
- **Delete course** button — removes a bad/duplicate course straight from the hub (with confirmation)

Five verification steps:

1. **Details** ✓
2. **Course name** — editable (rename if misspelled)
3. **City & state** — location info
4. Optional: **Phone number** & **website** (research helps later)

5.  **Rename course (admin)** button — fixes a mislabeled course while keeping all data/scores
6. **Rating & Tees** ✓
7. **Edit tees** button — add/update tee boxes
8. Requires: **at least 1 tee** with a valid name, rating (40–90), slope (55–155)
9. Shows current tee boxes with ratings/slopes
10. **Edit** button next to each tee to adjust
11. **Pars** ✓
12. **Edit pars** button — set par for each hole (1–18)
13. Par must be 3, 4, or 5
14. 18 holes required (can be split 9+9 for reversible courses)
15. Shows current pars; tap to edit
16. **GPS (Tees, Greens, Targets)** ✓
17. **Map course** button — **4-step wizard** to place each hole
18. Each hole is mapped by tapping, in order:
19. **Tee box** (1st tap)
20. **Target** — the middle of the fairway / ideal landing aim point (2nd tap)
21. **Front of green** (3rd tap)
22. **Back of green** (4th tap; mid-green is computed automatically)
23. Auto-advances to the next unmapped hole
24. **Clear hole** button — wipe a hole's mapping and re-map it on the spot
25. **Fairway Targets** ✓ (required for a course to count as "complete")
26. Each par 4/5 needs a **target** (the fairway-middle aim point). Mapping a hole with the 4-step wizard already captures it as the 2nd tap, so usually this step is done by the time greens are mapped
27. Use **Set / Update the fairway center (target)** on the GPS admin map to add or move a target on any hole — the flow steps through only the par-4/5 holes still missing one
28. Light green dot on the player's GPS shows the fairway center

Verify Button Gate (buildAdminWorklist → "complete" = greens + rating + targets):

- **Verify course** button is gated and only unlocks when ALL of:
 - ✓ Greens mapped — **≥ 18 holes** with tee/front/back
 - ✓ Rating & tee data filled (at least one tee with a valid rating/slope)
 - ✓ Targets placed — a fairway target on **every par 4/5** (par 3s don't need one)

After verification:

- Status changes to **verified** (green checkmark)
- Course appears as **● complete** in the library
- All players can use this course and its GPS data

Mapping a 27- or 36-Hole Facility (Nine by Nine)

Multi-nine facilities used to read **"0/18 · Not mapped"** no matter how much had been mapped — the work was always saving correctly, admin was just counting in the wrong place. That's fixed.

- The facility shows its **true expected total (27 or 36, not 18)**
- The mapping picker is **nine-first** — one full-width row per nine with its own live progress, e.g. **"Champions · 4/9 · 5 greens left"**, with a green dot when a nine is done
- The old 18-hole loop buttons are still there behind **"🔄 Or map a full 18-hole loop >"**
- The worklist card gains **per-nine chips** (grey / amber / green by progress) that tap straight through to mapping that nine

Do not rebuild nines from scratch. Map each nine **once** and the app assembles every 18-hole combination itself. A three-nine **round** is still 18 holes — only the "how much is left to map" expectation changed.

Same greens ≠ same holes. A course with 9 greens but different pars per loop is a real 18 and must not be trimmed to a nine.

Rating & Tees Editor (adminEditTees)

Opened from: Step 2 of Guided Verify Hub or from course detail card

Interface:

- **List of tee boxes** (e.g., Championship, Blue, White, Red)
- For each tee:
 - **Tee name** — editable text (e.g., "Black" or "Tips")
 - **Rating** — decimal number (e.g., 72.5)
 - **Slope** — integer 55–155 (e.g., 138)
 - **Reorder buttons** (▲ ▼) — move tee up/down the list

Actions:

- **Add new tee** — text input for name, then rating/slope
- **Edit any tee** — tap the row, update fields
- **Remove tee** — tap ✕ button
- **Save tee boxes** — persists all changes
- **Error checking:** Names required, rating 40–90, slope 55–155

Women's rating/slope per tee:

- Each tee can carry **separate men's and women's** numbers. Tap **" + Add women's rating/slope "** on a tee row to reveal **W Rating** and **W Slope** inputs (validated: rating 40–90, slope 55–155).
- Tees that already have women's numbers show a " ♀ **Women's** " marker. These feed the gender-aware handicap math so women are scored off the correct tee.

Auto-fill from BlueGolf:

- **"Auto-fill from BlueGolf (paste link)"** button — the fastest way to fill ratings/slopes. Tap **"Research course"** first (it opens BlueGolf), find the course, copy its web address, then paste it here.
- The app looks the course up on BlueGolf and fills in every tee's label plus **men's and women's** rating/slope automatically. Review and **Save**. (Only accepts a real bluegolf.com link.)

Reverse nines (multi-/reversible courses):

- **"Reverse nines (flip front ↔ back)"** button — swaps the front and back nine for courses that play the nines in the opposite order, so pars and stroke index line up correctly.

Your typing is saved. If you get interrupted mid-edit, reopening the editor refills what you had typed with the toast **"↩Restored what you were typing."** (30 minutes for auto-restore; up to 12 hours by tapping into the field.)

Pars Editor (adminEditPars)

Opened from: Step 3 of Guided Verify Hub

Interface (phone-friendly):

- **Holes 1–18** laid out as two 9-hole rows with running **Out / In / Total** par
- **PAR** — **tap a hole to cycle its par** (3 → 4 → 5 → back to 3); no keyboard needed
- **HANDICAP / stroke index** — a typeable number box per hole (1 = hardest ... 18); a **"duplicate values!"** warning shows if two holes share the same SI

Actions:

- **Tap a par cell** repeatedly to land on the right par
- **Type the SI** for each hole (optional — leaves the course's existing index alone if untouched)
- **Save pars** — persists changes (keeps existing tees and stroke index)

Same draft-restore behavior as the tees editor.

GPS Green Mapper (4-Step Wizard)

Opened from: Step 4 of Guided Verify Hub → **"Map course"** button (also reachable from the **Open GPS admin map** button on the course card)

4-tap workflow per hole (the banner tells you what to tap next):

1. **Tap the TEE BOX** — "Pinch to zoom in close first"
2. **Tap the TARGET** — the middle of the fairway / ideal landing aim point (this is also saved as the hole's fairway center)
3. **Tap the FRONT of the green** — the edge closest to the fairway
4. **Tap the BACK of the green** — mid-green is computed automatically

After the 4 taps:

- Hole is marked as **mapped** and the target is saved as that hole's fairway center
- System auto-advances to the next unmapped hole
- **Hole picker** at the top (◀select hole▶) lets you jump to **any** hole 1–18 to remap it — not just missing ones
- **↶ Undo** button — step back one tap
- **Clear hole** button (shows when the hole already has data) — wipes that hole's saved GPS so you can re-tap it; use this when a green got saved under the wrong hole number

The compass *(admin mapping sessions only)*:

- A 46px translucent dial in the **bottom-right**, above the "Find an address" button, never overlapping the bottom bar
- **Red needle = north** (the dial counter-rotates with the map)
- **Gold tick on the rim = your device's own heading**, shown only if the phone actually reports one
- **Tap the dial to snap the map back to north-up**. That tap is also what grants heading access on iOS, so no permission prompt fires just from opening the map.

On-hole setup panel (during an admin map session):

- **Per-hole nav** (◀▶) — step to the previous/next hole without redoing the course (reaches a mis-mapped hole)
- **Set / Update the fairway center (target)** button — shows on **every** mapped hole (including par 3s) so you can drop or move the target/aim point any time
- **Clear this hole** button — wipe just this one hole's GPS
- **▼ Minimize** — collapse the panel to see the whole map; **↗ Show options** brings it back
- Changes persist to the cloud automatically as you map

No phantom lock-screen card. Admin mapping, fairway-target mapping, and Course Preview no longer raise an Apple Live Activity as if a round had started, and closing a map session clears any orphaned card left over from an older build.

Fairway Center / Target Mapping (adminFwcCourse)

The fairway **target** is captured as **step 2 of the 4-step green wizard** (tap the middle of the fairway). You can also set or move it any time afterward.

Two ways to set a target:

- **During mapping** — the wizard's 2nd tap (the TARGET) is saved as that hole's fairway center automatically
- **From the GPS admin map** — the **Set / Update the fairway center (target)** button appears on **every mapped hole**, including par 3s (the par-3 target is harmless — the rangefinder always aims a par 3 at the green and ignores the stored target)

One-tap to place / move:

- Tap the ideal landing zone (e.g., middle of fairway, ~150 yds from the green) — a draggable target marker drops
- Auto-advance flow steps you through only the holes still missing a target

Fairway target on GPS (player view):

- Players see this as a green dot (distinct from the pin/flag)
- The rangefinder uses it to aim the layup yardage on par 4s/5s
- Only par-4/5 targets count toward a course being "complete" for verification

GPS Map Pins (Admin View)

On the course map (Guided Verify or regular GPS):

Numbered hole pins (drawn during a map session — a gap in the numbers shows the missing hole):

- **Blue square** — tee location (numbered by hole)
- **Green circle** — green location (numbered by hole)
- Pins are non-interactive markers; the gap in the sequence is the hole that still needs mapping
- On the course **map view** of the whole library, **verified courses pin blue** (); ● complete, ● mapped/needs-targets, ● partial, ○ no GPS, ● possible duplicate

Admin-only map controls:

- **"Show/Hide map view"** toggle
- Spectate any round dropdown (if an admin wants to watch a live round)
- GPS override buttons (force GPS mode, remap)

"Research Course" Button (adminPrepCourse)

Button: **"Research course — USGA · 18Birdies · BlueGolf"** at the top of the course card / Guided Verify Hub

Purpose: Open external reference sites so the admin can find a course's real rating, slope, and scorecard to key in (the app can't auto-pull these — no public USGA API).

Tabs opened (three new tabs):

- **USGA rating search** — find the course's rating/slope
- **18Birdies** — `site:18birdies.com` search for the course
- **BlueGolf** — scorecard / tee sheet lookup

Workflow:

1. Admin opens the course card / hub and taps **"Research course"**
2. The three reference tabs open
3. Admin reads the rating/slope and scorecard from them

4. Returns to the **Rating & Tees** and **Pars** editors and types the data in — or pastes the BlueGolf link into the auto-fill button
5. Note: in-app GPS imports (OSM) are run separately by the import team — this button is the lookup helper for verifying ratings/scorecards.

Scorecard Image Links & Viewer (adminSetScorecardImg)

A real photo/scan of a course's scorecard can be saved per course so the numbers can be verified at a glance.

Add / replace the image (admin):

- On the course card, tap **"Scorecard image — view / add link"**
- Paste a **URL** to a scorecard photo/scan (USGA DB, Google Images, etc.) — mobile-safe form modal
- There's also a **"Scorecard images ›"** Google Images link on the card to go find one

View it:

- A **"View real scorecard"** option opens the saved image **full-screen** as a reference while keying in pars/ratings
- If none is saved yet, an admin is prompted to add one; non-admins see "No scorecard image saved for this course yet"

Why: lets admins visually verify pars, stroke index, and tee ratings and catch data-entry errors. Attaching a photo to a course is also **logged into that course's code-review history** automatically.

Per-Hole GPS Setup Screen

Four-step wizard (map session):

- After each 4-tap set (tee + target + front + back), the panel shows:
 - **Hole number & par**
 - **Mapped status** checkmark
 - **Next/Clear buttons**

Setup panel (during a map session):

- **Hole picker** (◀ select hole ▶) — jump to any hole 1–18 to map or remap it
- **Per-hole nav** (◀▶) — step to the previous/next hole
- **Clear this hole** — wipe just this hole's GPS
- **▼ Minimize / ↗ Show options** — collapse the box to see the map, then expand
- **Done mapping** button — exit and persist to the cloud (mapping also saves as you go)

"Set Fairway Center" & Fairway Targets

On any mapped hole (GPS admin map):

- Tap **"Set / Update the fairway center (target)"** — the button is present on every mapped hole, par 3s included
- A **draggable target marker** drops on the map; grab and move it to the ideal landing area (e.g., ~150 yds from the green)
- The target persists per hole and is what the rangefinder aims the layup yardage at
- Targets on par 4s/5s are required for the course to read "complete"; par-3 targets are stored but ignored in play

Admin Analytics Dashboard

"Analytics" card (Admin tab):

Date filters:

- **Date range picker** — view metrics for a specific period (default: last 30 days)
- **Preset ranges:** This week, Last 30 days, All time

Course request counts:

- **"Course requests"** metric — how many "Can't find a course?" requests came in
- Shows pending requests with course names and requester names
- **Send request to course** workflow appears here (Mark as added, assign to existing course, etc.)

Other admin metrics:

- **Total courses** in library
- **Verified courses** (complete)
- **Incomplete courses** (need mapping or ratings)
- **Live rounds** (in progress)

User Management

"Users & players" section (Admin tab):

Search:

- **"Search by name or email..."** input field
- Finds users or players in the roster

User actions (per row):

- **Reset password** — send password reset email to this user
- **Make Admin** — grant admin role (appears if user is not yet admin)
- **Revoke Admin** — remove admin role (appears if user is already admin)

- **Relink player** — re-point this user's `my_player` at the correct surviving roster name (fixes a user attached to a stale/duplicate roster entry after a merge)
- **Delete** — remove user account entirely (careful! confirms choice)

Account linking:

- Users who sign in are auto-linked to a player (by name match)
- **Unlink** option (if manually linked incorrectly)
- **Link to player** — admin can manually assign a user to a player account

Duplicate player detection & merge:

- Shows possible duplicates (same/similar names)
- **Merge duplicate players** modal (`mergeRosterPlayers`) — combine two player records:
- Choose which player keeps the name/handicap/photo
- The other's rounds/scores are transferred to the survivor
- Any user whose account pointed at the merged-away player is **auto-repointed** to the survivor
- The merged player is removed
- If a user is still attached to the wrong name after a merge, use the **Relink player** button on that user's row to fix it manually

Roster Cleanup merges duplicate-name entries — run it when players report a stranger's round showing up in their list. (Tell the player to remove the row with "x" → **"Just my list"**, never "Delete for all.")

GPS Admin Map Button (Guided Verify Hub)

"Open GPS admin map — fix a hole" button (on the course card):

- Opens a map view of the course with:
- Pins for each hole (white = tee, green = greens)
- Fairway center pins (light green dots)
- Markers colored by mapping status
- The compass in the bottom-right

Admin-only options on GPS map:

- **Edit tees / pars / centers** inline
- **Remap full course** — start the 4-step wizard from the map (any hole, in any order)
- The admin map opens straight to GPS for that course; the `/gpsadmin` action sets a "reopen the hub afterward" flag so you land back on the Guided Verify Hub when done

Admin map view layout (`.map-only`):

- The live **FRONT/MID/BACK top bar is hidden** (no live play during mapping)
- The **PAR** of the current hole shows in a box, upper-right
- The setup/options box is **bottom-centered** so it never covers the hole you're reviewing

- A **Done mapping** button sits at the bottom to exit and save

Course / Remap Requests Feature

Course requests workflow:

- Players who can't find a course tap "**Can't find a course?**" and submit a request
- Admin dashboard shows pending requests

Admin actions:

- **View request** — see course name, submitter
 - **Add to library** — manually create the course record
 - **Assign to existing** — if the course already exists, link the request to it
 - **Dismiss** — close the request
 - Request triggers a **notification to the player** once the course is added
-

Common Admin Workflows

Mapping a New Course (Admin)

1. **Admin tab** → **Courses card**
 2. Check the state isn't **locked** (a locked state blocks every admin write)
 3. **Search for course** (if not in library, create it)
 4. Tap the course card → **Guided Verify Hub**
 5. **Step 1: Details** — enter name, city, state (optional phone/website)
 6. **Step 2: Rating & Tees** → **Edit tees** — add tee boxes with rating/slope, or paste a BlueGolf link into "Auto-fill from BlueGolf"
 7. **Step 3: Pars** → **Edit pars** — tap to cycle par, type the stroke index
 8. **Step 4: GPS** → **Map course** — **4 taps per hole**: tee → target (fairway middle) → front green → back green; the target tap doubles as the hole's fairway center. On a 27- or 36-hole facility, map **one nine at a time** from the nine-first picker
 9. **Step 5: Fairway targets** — confirm every par 4/5 has a target; add or move any with **Set / Update the fairway center** on the GPS admin map
 10. Tap **"Verify course"** (unlocks once greens ≥ 18 + rating + all par-4/5 targets are in) → course is now **complete** ●
 11. When the whole state is finished, **"Lock — mark complete & freeze"** with a note
-

Admin Tips & Tricks

- **Check the state isn't locked** before you start — a state blocks every admin write until someone unlocks it
 - **Research course first** (Research course button) — or paste the BlueGolf link straight into **"Auto-fill from BlueGolf"** to fill every tee's men's and women's rating/slope at once
 - **Map courses the first time anyone plays them** (Step 4: GPS, 4 taps per hole) — subsequent players benefit forever; the target tap also sets the fairway center, so most holes are done in one pass
 - **On a 27- or 36-hole facility, map one nine at a time** from the nine-first picker — never rebuild nines from scratch; the app assembles every 18-hole combination itself
 - **Tap the compass** on the admin map to snap back to north-up when you've spun the map around
 - **Confirm every par 4/5 has a target** before verifying — the **Set / Update the fairway center** button on the GPS admin map covers any you missed
 - **Log your work in the code-review queue** — **"Log work"** takes what you fixed, what you couldn't do and why, and what's still needed, and a note is required to mark complete or send back
 - **Check for duplicate courses** (Courses card → ● filter) and merge them; use **Relink player** to fix a user stuck on a stale roster name after a merge
 - **Monitor course requests** (Analytics card) — users will ask you to add new courses; batch them weekly
 - **Lock the state when it's done** and leave a note saying what "done" meant
-
